- Note:
1. LOD = Limit of Detection. LOD is referred to the estimated Level of Detection at 50% of probability of detection (eLOD50) when applied to the qualitative microbiological analytes, Probability of Detection (POD) when applied to qualitative chemical analytes, or Probability of Identification (POI) when applied to identification analytes. The result of the analyte with the concentration below or equal to LOD is reported as Not Detected.
 2. LOQ = Limit of Quantification. When the chemical analyte is detected but its concentration is below limit of quantitation (LOQ), the result is reported as <LOQ. If the quantifiable result was calculated from sum of individual analytes, it was done using unrounded single values without the ones below LOQ. For microbiological analytes, according to the plate count testing method with the initial dilution factor of 10, the result of the sample that the relevant colonies were not formed was reported as <10 cfu/g or Not Detected (at LOQ = 10) to meet some specific regulations (for samples without further dilution), <100 cfu/g (for samples with further dilution of 10), <1 cfu/mL (for pipettable samples without dilution), <10 cfu/sample (or <10 cfu/swab for hygiene environment samples that are required to report on whole tested samples), or <10 cfu/area (for hygiene environment samples that are required to report on specific area); according to the membrane filter method without further dilution, the result of the sample that the relevant colonies were not formed was reported as <1 cfu per sample volume tested or Not Detected per sample volume tested (at LOQ = 1) to meet some specific regulations.
_(a) Refer to LOD/LOQ of the individual analytes that were used to calculate the sum item.
 3. The tests were performed on brown surface only.

Remark: These tests were performed by SGS Vietnam's Food lab.
